```

```
<body styl
```

```
  <!-- L
    <H
    <h
    <i
    <!--
    <ol typ
```

- Authors are encouraged to use [UTF-8](#).

- Authors should not use ASCII-incompatible encodings to avoid security risk: browsers not supporting them may interpret harmful content as HTML. This happens with the [JIS_C6226-1983](#), [JIS_X0212-1990](#), [HZ-GB-2312](#), [JOHAB](#), the ISO-2022 family and the EBCDIC family.

Note: ASCII-incompatible encodings are those that don't map the 8-bit code points `0x20` to `0x7E` to the `0x0020` to `0x007E` Unicode code points)

- Authors **must not** use [CESU-8](#), [UTF-7](#), [BOCU-1](#) and/or [SCSU](#) as [cross-site scripting](#) attacks with these encodings have been demonstrated.

- Authors should not use [UTF-32](#) because not all HTML5 encoding algorithms can distinguish it from [UTF-16](#).
